# CURRENT STATUS OF ARIES FINGER AND T-TUBE DIVERTOR CONCEPTS

## 1. HCPF(He-cooled Combined Plate and Finger)\*

- ✓  $q'' = 15 \text{ MW/m}^2$
- ✓  $P_p / P_{th} < 10\%$
- ✓  $700 \text{ }^\circ\text{C} < T < 1300 \text{ }^\circ\text{C}$  for W structure
- ✓ Allowing yielding, within elastic regime after stress relaxation of plasticity

\*\*With pin-fin array, accommodating  $\sim 22 \text{ MW/m}^2$   
(without stress verification)

\*X.R. Wang, S. Malang and M. S. Tillack, 19<sup>th</sup> TOFE, to be published in *Fusion Science and Technology*.

\*\*M. Yoda, S.I. Abdel-Khalik et. al, 19<sup>th</sup> TOFE, to be published in *Fusion Science and Technology*.

\*\*\*J. Burke and et. al, 19<sup>th</sup> TOFE, to be published in *Fusion Science and Technology*.

## 2. HCTT(He-Cooled T-Tube)\*\*\*

- ✓ Tapered ODS-steel cartridge
- ✓  $q'' = 13 \text{ MW/m}^2$
- ✓  $P_p / P_{th} < 10\%$
- ✓  $700 \text{ }^\circ\text{C} < T < 1300 \text{ }^\circ\text{C}$  for W structure
- ✓ Within Elastic regime

# STATUS OF THE ARIES PLATE-TYPE DIVERTOR CONCEPT

## 3. HCFP(Helium-cooled Flat Plate) divertor

Jet-to-wall distance  $h=1.2$  mm  
 Jet width  $D=0.5$  mm  
 Front plate,  $t_f=2$  mm  
 Side wall,  $t_s=3$  mm  
 Back plate,  $t_b=8$  mm

2 mm He insulator gap used to make the cooling duct operating in range of 1075-1300 °C to reduce thermal stresses

$q''=10$  MW/m<sup>2</sup>  
 $q_v=17.5$  MW/m<sup>3</sup>  
 $P=10$  MPa  
 $T_{in}/T_{out}=600/677$  °C  
 $HTC \sim 4.822 \times 10^4$  W/m<sup>2</sup>K  
 $T_{thimble}=1295$  °C  
 $P_P=9.7\%$   $P_{th}$   
 $\sigma_{(p+s)}=359$  MPa(within elastic regime)

# CAN THE HCFP CONCEPT BE SIMPLIFIED FOR PUSHING TO HIGHER HEAT FLUX?

**Design Method: Allowing local yield and considering plasticity.**

Simplified to

- ✓ Getting rid off the U-shape wall for simplifying the design
- ✓ More space for increasing cross-sections for manifolds and reducing  $\Delta P$
- ✓ Increasing temperature design window

Verifications needed:

- ✓ CFD analyses
- ✓ Elasto-plastic analysis
- ✓ Cyclic thermo-mechanics

# PARAMETER STUDIES AND OPTIMIZATIONS OF THERMAL PERFORMANCE BY USING CFX

- CFX was used in the parameter studies and optimizations.
- The plate without pin fins are used.
- Different cooling conditions were analyzed
  - ✓  $\Delta T1=677-600$  °C (Original design)
  - ✓  $\Delta T2=700-623$  °C
  - ✓  $\Delta T3=700-600$  °C
- Jet sizes are varying from 0.15 to 0.5 mm
- The plate-type divertor can accommodate the surface heat flux up to  $11 \text{ MW/m}^2$  while staying within temperature and pumping power constraints.
  - ✓  $T_s < \sim 1300^\circ\text{C}$  (Re-crystallization temperature)
  - ✓  $P_p < \sim 10\% P_{\text{removed thermal power}}$
- The plate-type divertor with pin fins can enhance the heat transfer coefficient ( it is not included in this plot)\*\*

$q'' < 9 \text{ MW/m}^2$ ,  $\Delta T3$  is better option  
 $q'' > 9 \text{ MW/m}^2$ ,  $\Delta T1$  is better option

# COMPARISON OF THERMAL PERFORMANCE FOR THREE CONCEPTS

- W structure temperature limit  $700\text{ }^{\circ}\text{C} < T_s < 1300\text{ }^{\circ}\text{C}$
- All thermal-hydraulic analyses were performed by CFX
- Finger concept has better thermal performance.
- The finger (HEMJ) with pin fins can handle the heat flux up to  $22\text{ MW/m}^2$ .\*\* (it is not shown)

Temperature distribution (W-armor not shown)

# THERMO-MECHANICAL ANALYSIS FOR THE HEAT FLUX UP TO 11 MW/M<sup>2</sup>

➤ Only half of cooling channel is considered in the thermo-mechanical simulation.

➤ ODS insert manifold is excluded from thermo-mechanical model.

➤ Thermal boundary conditions and structural supports:

✓ the interface temperature of the He/W is imported from the CFX thermal results

✓ Thermal expansion and bending are free.

(CFX results)

One coolant channel  
(without manifold)

# EXAMPLE RESULTS OF THE ELASTIC STRUCTURAL ANALYSIS

Stress distributions

- The plate-type divertor can accommodate the heat flux up to 9 MW/m² for maintaining the structure in the elastic regime ( $3S_m = 373$  MPa at  $T_s = 1300$  °C).

# EXAMPLE OF ELSTO-PLASTIC ANALYSES FOR A HEAT FLUX OF 11MW/M<sup>2</sup>

## Design Criteria:

Allowable plastic strain has to be less than 50% of the uniform elongation of the material:

- ✓  $\epsilon_{\text{allow}} \approx 0.8\%$  for W at 270°C
- ✓  $\epsilon_{\text{allow}} \approx 1.0\%$  for W at 1200 °C

➤ The maximum plastic strains calculated by ANSYS:

- ✓  $\epsilon_{\text{pl}} \approx 0.026\%$  in the channel
- ✓  $\epsilon_{\text{pl}} \approx 0.03\%$  in the armor

➤ Total deformation is ~3.1 mm (increase of the plate length)

➤ Plastic design criteria are met for the maximum surface up to 11 MW/m<sup>2</sup>.

Plastic strain of the cooling channel

Plastic strain of the tiles (on the top of the channel)

Elastic Analysis

Elastic-Plastic  
Analysis

# ELASTO-PLASTIC ANALYSES FOR THE HEAT FLUX UP TO 15MW/M<sup>2</sup>

- The maximum plastic strains at the channel structure and the armor  $\sim 0.04\%$  and  $0.05\%$ , respectively (**allowable plastic strain  $\epsilon_{\text{allow}} \sim 1\%$** ).
- The structural behavior stays in the elastic regime after stress relaxation of the plasticity ( **$3 S_m \sim 410 \text{ MPa}$**  at  $T_s = 1265 \text{ }^\circ\text{C}$ ). However, the pumping power for the heat flux of  $15 \text{ MW/m}^2$  is too high and the minimum temperature  $< 700 \text{ }^\circ\text{C}$ .

# SUMMARY AND CONCLUSIONS

- The HCFP divertor has been re-investigated and simplified by considering “yielding”, stress-relaxation and plasticity, and the U-tube for stagnant helium insulator gap inside of channel can be eliminated.
- Parametric studies have been performed by 3D CFX, and thermal-hydraulic results indicate that:
  - ✓  $\Delta T_3 = T_{\text{exit}} - T_{\text{inlet}} = 700 - 600 \text{ }^{\circ}\text{C}$  is better option for the  $q'' < 9 \text{ MW/m}^2$
  - ✓  $\Delta T_1 = T_{\text{exit}} - T_{\text{inlet}} = 677 - 600 \text{ }^{\circ}\text{C}$  is better option for the  $q'' > 9 \text{ MW/m}^2$
- **The simplified HCFP divertor** can accommodate the surface heat flux up to **11 MW/m<sup>2</sup>** while staying into the temperature and pumping power limits.
- **Stress is not very important limit constraint** any more comparing to the temperature and pumping power **when the local yielding is allowed**.
- However, it remains to be seen if cyclic loading leads to ratcheting with  $\epsilon_{pl} > \epsilon_{\text{allow}}$ .
- **Modifications for all the divertor concepts are required to increase minimum W temperature from ~720 °C to >800 °C.**
